Citation: Qi X, Tang H, Wang X (2016) Notes on *Nilothauma* Kieffer from Oriental China, with descriptions of three new species (Diptera, Chironomidae). ZooKeys 574: 143–159. doi: 10.3897/zookeys.574.6129

Abstract

Three new species of *Nilothauma* Kieffer are described and figured from Oriental China: *N. angustum* **sp. n.** based on the male only, *N. aristatum* **sp. n.** based on the male, pupa and larva, and *N. bilobatum* **sp. n.** based on the male and pupa. In addition, new distribution records are given for *N. japonicum* Niitsuma, *N. nojirimaculatum* Sasa, *N. hibaratertium* Sasa, and *N. acre* Adam & Sæther. A key to known males of *Nilothauma* Kieffer in China is provided.

Keywords

Nilothauma, new species, new records, Oriental China, key

Introduction

The genus *Nilothauma* Kieffer, 1921 is represented by 43 species: six species occurring in the Palearctic region, four in the Nearctic region, 16 in the Neotropical region (not including *N. aleta* Roback and *N. duena* Roback due to the uncertain status), six species in the Oriental region, 11 species in the Afrotropical region, two species in the Australasian region, and two species occurring both in the Palearctic and Oriental

regions (Adam and Sæther 1999; Mendes and Andersen 2009; Qi et al. 2014). From China, five species have been recorded: *N. japonicum* Niitsuma, *N. nojirimaculatum* Sasa, *N. acre* Adam & Sæther, *N. quatuorlobum* Yan, Tang & Wang, and *N. pandum* Qi, Lin, Wang & Shao; all in the Oriental part of the country. No adult information is available on the genus from Palearctic parts of China.

In the present paper, we present new material of *Nilothauma* from Oriental China. Three species are described as new to China, and new distributional records are given for *N. acre* Adam & Sæther, *N. hibaratertium* Sasa, *N. japonicum* Niitsuma and *N. nojirimaculatum* Sasa. We also present an identification key to males of *Nilothauma* in China.

Materials and methods

Descriptions of morphological characters are based on slide-mounted specimens in Euparal. Terminology for morphology and abbreviations follow Sæther (1980) and Adam and Sæther (1999).

Most of the specimens examined here are deposited in the College of Life Science, Taizhou University (LTZU) and partial in Nankai University (LNKU). The holotype specimens of three new species are deposited in the Ecology Department, Jinan University (EJNU).

Taxonomy

Nilothauma angustum sp. n.

<http://zoobank.org/6AEAD9D5-C373-4D0A-822A-5449C7A62C06>

Figs 1–11

Type material. Holotype: male (EJNU), CHINA: Yunnan, Ximeng City, Mengsuo Lake, 22°38.689'N, 99°35.631'E, Alt. 1090m, 27.viii.2014, Tang HQ, light trap. Paratype: 1 male (LTZU), as holotype.

Diagnosis. The adult male of *N. angustum* sp. n. can be distinguished from all other known species of the genus by the following combination of characters: wing with four partially connected dark markings; anterior T IX projection extensively microtrichiose, divided into two lobes, each with apical simple setae forming a fan-like structure; posterior T IX projection extensively microtrichiose, nearly parallel-sided, setose, with long anterolateral arms; anal point broadly lanceolate, microtrichiose along the median ridge and the apical margin; median volsella with microtrichia and two apical setae; gonostylus peaked apically.

Etymology. From the Latin *angustus* (narrow), referring to the male hypopygium with apically narrowed gonostylus.

Figures 1–11. *Nilothauma angustum* sp. n., male. 1 wing 2 thorax, lateral view 3 legs 4 foretibial apex 5 mid tibial apex 6 hind tibial apex 7 hypopygium, dorsal view (left) and ventral view (right) 8 anterior anal tergal projection 9 posterior anal tergal projection 10 anal point 11 posterior margin of anal tergite.

Description. Male imago (n = 2).

Total length 2.1–2.2 mm. Wing length 0.9–1.1 mm. Total length/wing length 2.1–2.2. Wing length/length of profemur 2.1–2.2.

Coloration. Generally yellow, thorax (Fig. 2) yellow except scutum, pre-episternum, scutellum and postnotum dark brown, abdomen yellowish brown. Wing with 4 partially connected dark markings (Fig. 1). Foreleg yellow with both ends of femur, apex of tibia, apical 1/3 of ta_1 and ta_{2-5} brown; mid leg with sub-apex of femur and sub-base of tibia brown; hind leg with sub-apex of femur brown (Fig. 3).

Head. AR 0.18–0.20. Temporals 7–11, uniserial. Clypeus with 17–19 setae. Tentorium 80–108 μm long, 11–15 μm wide; stipes 50–65 μm long, 6–8 μm wide. Lengths of palpomeres 1–5 (in μm): 28–30, 25–30, 58–63, 85–105, 125–130. Palpomere 3 with 2 sensilla clavata; Pm_5/Pm_3 2.1–2.2.

orax (Fig. 2). Anteprenotal lobe much reduced. Dorsocentrals 9–10, uniserial; acrostichals 7–9, biserial; prealars 2. Scutellum with 2 setae.

Wing (Fig. 1). VR 1.5–1.6. Brachiolum with 1 seta, R with 9–13 setae, R_1 with 6–9 setae, R_{4+5} with 10–11 setae.

Legs (Fig. 3). Spur of fore tibia 63–65 μm long including 30–35 μm long scale (Fig. 4). Spur of mid tibia 20–25 μm long (Fig. 5) including 13–15 μm long comb. Spurs of hind tibia 18–25 μm and 28–30 μm long, respectively; comb 15–20 μm long (Fig. 6). Width at apex of fore tibia 28–30 μm , of mid tibia 33–35 μm , of hind tibia 30–34 μm . Lengths and proportions of legs in Table 1.

Hypopygium (Fig. 7). Tergite IX with 2 dorsal projections. Anterior projection (Fig. 8) microtrichiose, 60–63 μm long, 20–23 μm wide at base, split into 2 lobes; each 40–45 μm long, 10–12 μm wide at base, 5–6 μm wide at apex, with simple apical setae, together forming fan-like structure. Posterior projection (Fig. 9) extensively microtrichiose, 37–40 μm long, 35–40 μm wide at base, 17–20 μm wide at apex, nearly parallel-sided, apically rounded with 8 setae; long anterolateral arms present. Anal point (Fig. 10) broadly lanceolate, 30–35 μm long, 25–28 μm wide at base, 28–30 μm wide at middle, with microtrichia along median ridge and apical margin. Posterior margin of tergite IX (Fig. 11) with 8–10 setae located to each side of anal point. Laterosternite IX with 3 setae. Phallopodeme 28–30 μm long. Transverse sternapodeme rounded medially without median elongation. Gonocoxite 78–80 μm long. Superior volsella 30–35 μm long, slender, club-shaped with 4 apical setae, without microtrichia. Median volsella 8–10 μm long, with 2 apical setae and microtrichia. Inferior volsella 53–58 μm long, pointed apically, with microtrichia and 6–7 apically cleft setae. Gonostylus 88–90 μm long, apically narrowed and peaked, with row of 4–5 split distal-median setae. HR 0.86–0.89, HV 2.3–2.5.

Table 1. Lengths (μm) and proportions of legs of *Nilothauma angustum* sp. n., male (n = 2).

	fe	ti	ta_1	ta_2	ta_3	ta_4	ta_5	LR	BV	SV
P_1	438–500	325–360	438–500	155–195	130–150	105–110	70–80	1.4	2.5–2.6	1.7
P_2	450–500	325–338	185–190	80–100	60–75	50–63	50–60	0.56–0.58	3.5–4.4	3.6–4.1
P_3	488–538	488–538	270–320	135–165	140–165	100–108	70–78	0.55–0.60	2.7–2.8	3.4–3.6

Table 2. Comparison of male hypopygial characters in *N. angustum* sp. n., *N. abellatum* Adam & Sæther and *N. kakumense* Adam & Sæther.

	<i>N. angustum</i> sp. n.	<i>N. flabellatum</i>	<i>N. kakumense</i>
Anterior T IX projection	with simple setae	with apically branched setae	with apically widened and unbranched setae
Main part of posterior T IX projection	with microtrichia	without microtrichia	without microtrichia
Median volsella	with microtrichia	without microtrichia	without microtrichia
Anal point	without distal-median knob	with distal-median knob	with distal-median knob
Transverse sternapodeme	without median elongation	with median elongation	without median elongation

Female imago, pupa and larva. Unknown.

Remarks. The male hypopygium is similar to those of *N. abellatum* Adam & Sæther, 1999 and *N. kakumense* Adam & Sæther, 1999 as the anterior T IX projection has long apical setae forming fan-like structures. The differences between these three species are given in Table 2.

Distribution. Oriental China (Yunnan Province).

Biological note. The males were collected at the bank of Mengsuo Lake by light trap, where the nutrient levels are relatively high (conductivity 39–42 $\mu\text{s}/\text{cm}$, chlorophyll-a 10.5–11.1 $\mu\text{g}/\text{l}$). The co-occurring dominant species are eutrophic taxa, such as *Kie erulus* sp., *Polypedilum nubeculosum* (Meigen), *Polypedilum sordens* (van der Wulp), and *Tanytarsus oscillans* Johannsen.

***Nilothauma aristatum* sp. n.**

<http://zoobank.org/53489B41-D9EC-4AA2-AC3B-B6001B819231>

Figs 12–24

Type material. Holotype: male with pupal exuviae (EJNU), CHINA: Anhui Province, Huangshan Nature Conservation Reserve, stream in Huang Mountain, 30°04.317'N, 118°09.320'E, Alt. 520 m, 4.v.2014, Tang HQ, light trap. Paratypes: 1 male (LTZU), CHINA: Zhejiang Province, Lin-An City, Tianmu Mountain, 16.vii.2012, Lin XL, hand net; male with larval and pupal exuviae (LTZU), reared by Lin XL, as previous; 3 pupal exuviae (EJNU), CHINA: Guangdong Province, Dongguan City, Yinping Nature Conservation Reserve, 22°53.772'N, 114°14.086'E, 17.iv.2012, Tang HQ, hand net.

Diagnosis. The adult male of *N. aristatum* sp. n. can be distinguished from other known *Nilothauma* species by the anterior T IX projection with plumose setae; the anal point broadly lanceolate with microtrichia along the median ridge; the superior volsella slender with a lateral spur, and one lateral and 2–3 apical setae, without microtrichia. The pupa is characterized by the relatively short frontal setae (1.5–2.0 times as long as the major axis of basal ring); and the anal comb of abdominal segment VIII consisting of a main spur and a single accessory spine. The larva cannot be reliably separated from those of other species.

Figures 12–17. *Nilothauma aristatum* sp. n., male. 12 wing 13 foretibial apex 14 mid tibial apex 15 hind tibial apex 16 hypopygium, dorsal view (left) and ventral view (right) 17 posterior margin of anal tergite.

Etymology. From Latin *aristatus* (aristate), referring to the male hypopygium with a lateral spur on the superior volsella.

Description. Male imago (n = 2).

Total length 3.0–3.5 mm. Wing length 1.4–2.1 mm. Total length/wing length 1.7–2.2. Wing length/length of profemur 1.9–2.6.

Coloration. Entirely pale yellow. Wing without any marking (Fig. 12).

Head. AR 0.16–0.21. Temporals 6. Clypeus with 10–13 setae. Tentorium 145–170 μm long, 21–23 μm wide. Stipes 85–90 μm long, 8–10 μm wide. Lengths of palpomeres 1–5 (μm): 30–32, 30–40, 70–80, 130–140, 155–160. Palpomere 3 with 2 sensilla clavata, longest 10 μm long. Pm_5/Pm_3 1.9–2.3.

orax. Dorsocentrals 5–7, acrostichals 10–15, prealars 2–3, scutellars 1–2.

Wing. VR 1.4. Brachiolum with 1 seta, R with 13–15 setae, R_1 with 11 setae, R_{4+5} with 3–4 setae.

Legs. Spur of foretibia 68–75 μm long including 30–43 μm long scale (Fig. 13). Spur of mid tibia 30–38 μm long (Fig. 14) including 16–25 μm long comb. Spurs of hind tibia 30–38 μm and 37–40 μm long, respectively (Fig. 15); comb 15–28 μm long. Width at apex of foretibia 40–50 μm , of mid tibia 45–50 μm , of hind tibia 43–54 μm . Lengths and proportions of legs in Table 3.

Hypopygium (Fig. 16). Tergite IX with 2 dorsal projections. Anterior projection completely divided into 2 oval lobes; each 35–37 μm long, 12–13 μm wide at middle, with 8–10 plumose setae 50–63 μm long. Posterior projection 10–12 μm long, 10–13 μm wide at base, 5–6 μm wide at apex, apically rounded, with 5 setae 13–20 μm long. Anal point very broadly lanceolate, 50–60 μm long, 18–20 μm at base, 25–27 μm at middle, with microtrichia along median ridge. Posterior margin of tergite IX (Fig. 17) with 9–11 setae. Laterosternite IX with 3 setae. Phallapodeme 37–40 μm long. Transverse sternapodeme without median elongation. Gonocoxite 114–120 μm long. Superior volsella 45–50 μm long, with lateral spur, and one lateral and 2–3 apical setae, without microtrichia. Median volsella 10–13 μm long, bearing 2 apical setae and microtrichia. Inferior volsella 78–90 μm long, curved dorsally, pointed apically, with microtrichia and 5 apically branched setae. Gonostylus 110–130 μm long, with 8 split median setae in distal 1/3. HR 1.02–0.92, HV 2.69–2.73.

Pupa (n = 4).

Total length 3.5–4.4 mm. Exuviae pale brown with anal comb on abdominal segment VIII yellowish brown.

Cephalothorax. Frontal seta short, 30–50 μm long (n = 2). Basal ring small, stoma-like, with major axis 20–25 μm long, minor axis 5–8 μm high. Frontal setae 1.8–2.0 times as long as major axis of basal ring. Thorax pebbled and rugose dorsally.

Table 3. Lengths (μm) and proportions of legs of *Nilothauma aristatum* sp. n., male (n = 2).

	fe	ti	ta ₁	ta ₂	ta ₃	ta ₄	ta ₅	LR	BV	SV

Figures 18–24. *Nilothauma aristatum* sp. n., pupa (18–21) and larva (22–24). 18 dorsal view of the abdomen (male) 19 anal comb of abdominal segment VIII, showing combs of both sides 20 ventral view of abdomen I–VIII 21 dorsal view of abdomen IX (female) 22 antenna 23 mandible 24 mentum.

Abdomen (Fig. 18). Tergite I without spinulation; T II–VI extensively spinulated; T VII with anterior and posterior bands of spines; T VIII with anterolateral and median bands of spines; tergite T IX with median spinulation in female (Fig. 21), but without any spinulation in male. S I–II without spinulation; S III–IV with anterior spinulation; sternite IV with weak anterolateral spinulation; S V with weak anterolateral and caudolateral spinulation; S VI–VIII with anterolateral and median spinulation, occasionally anterolateral spinulation merged to median in S VIII (Fig. 20). T II with row of 70–78 caudal hooklets with posterior groups of points behind each end. Conjunctives III/IV and IV/V with rows of spinules. Pedes spurii B weakly developed on segment II. Anal comb of segment VIII (Fig. 19) composed of main spur 20–30 μm long and single accessory spine 7.5–17.5 μm long. Segment I without L-setae; segments II–III each with 3 L-setae on each side; segment IV with 2 L-setae and 1 LS-seta on each side; segments V–VIII each with 4 LS-setae on each side. Anal lobe 200–240 μm long, 2.4–2.6 times as long as broad, with 35–48 lateral setae, dorsal seta located near distal 1/3.

Larva (n = 1).

Total length 5 mm. Head capsule about 300 μm long, about 260 μm wide.

Coloration. Red color in fresh specimens, head pale yellow. Mentum and postocipital margin brown.

Antenna (Fig. 22). Lengths of antennal segments 1–6 (μm): 28, 10, 4, 13, 4, 4. AR 0.8. Basal segment with ring organ situated in distal 1/6; antennal blade 25 μm long, extending to apex of segment 4; segment 6 hair-like, almost as long as segment 5.

Mandible (Fig. 23). Total length 85 μm . Apical tooth 40 μm long; 4 inner teeth small, arising from common base. Seta subdentalis 30 μm long, reaching middle of apical tooth.

Mentum (Fig. 24). Width 55 μm . Two pale median teeth and 7 pairs of gradually decreasing lateral teeth present. Ventromental plate 65 μm wide.

Female imago. Unknown.

Remarks. The male is similar to that of Oriental species *N. acre* Adam & Sæther, 1999 in having the wing unmarked, the anterior T IX projection with plumose setae, the anal point lanceolate, and the superior volsella slender with a lateral spur and one lateral and two three apical setae. It differs from it as the anal point bears microtrichia along the median ridge, the superior volsella is relatively long compared to the median volsella (length ratio, $\text{Svo}/\text{Mvo} > 4.0$) and the inferior volsella has simple setae only. In *N. acre*, the anal point is bare, length of Svo/Mvo is around 2.0 and the inferior volsella has apically split setae.

The pupa of *N. aristatum* sp. n. will key to “*N. sp. Australia*” in Adam and Sæther (1999), but may be separable by the relatively short frontal setae. The ratio of the length of the frontal seta to the length of the major axis of basal ring is 1.8–2.0 in *N. aristatum* sp. n., but 4.6–6.5 in the latter. The larva of *N. aristatum* sp. n. somewhat resembles that of *N. japonicum* Niitsuma, 1985, but it remains uncertain because of a paucity of data.

Distribution. Oriental China (Anhui, Guangdong and Zhejiang Provinces).

Biological note. The larva and pupa of *N. aristatum* sp. n. are found in first-, or second-order streams. The water is relatively clean and cold (water temperature 15°C–20°C, pH 7.80–7.88, DO% 90.6–93.4, DO 8.09–9.36 mg/l, and conductivity 25–34 $\mu\text{s}/\text{cm}$). The co-existing dominant species of chironomids are *Eukie eriella* spp., *Rheotanytarsus* spp., *Rheocricotopus* spp., and *Parametriocnemus* spp. Some steno-thermic species, such as *Heleniella* sp. and *Pagastia* sp., are frequently observed in the pupal exuviae samples.

Legs. Spur of foretibia 60–80 μm long including 28–38 μm long scale (Fig. 26). Spur of mid tibia 22–25 μm long including 15–23 μm long (Fig. 27). Spurs of hind tibia 27–35 μm and 33–47 μm long, respectively (Fig. 28); comb 17–24 μm long. Width at apex of foretibia 34–42 μm , of mid tibia 41–52 μm , of hind tibia 48–50 μm . Lengths and proportions of legs in Table 4.

Hypopygium (Fig. 29). Tergite IX with 2 dorsal projections. Anterior projection completely divided into 2 oval lobes; each 35–55 μm long, 8–10 μm wide at middle, with 12–15 simple setae 30–50 μm long. Posterior projection 28–32 μm long, 50–65 μm wide at base, 8–15 μm wide at apex, apically rounded, with 11–13 setae 20–25 μm long. Anal point (Fig. 30) very broadly lanceolate, 35–50 μm long, 13–20 μm at base, 15–20 μm at middle, with microtrichia. Posterior margin of tergite IX (Fig. 31) with 4–6 setae. Laterosternite IX with 3 setae. Phallapodeme 38–50 μm long. Transverse sternapodeme medially triangular, but without median elongation. Gonocoxite 100–120 μm long. Superior volsella 30–38 μm long, trifid; with lateral spur, main lobe bearing 4–5 apical setae, and blunt-tipped lobe terminating in seta; without microtrichia. Median volsella (Fig. 32) 20–30 μm long, with microtrichia and 4–6 apical setae. Inferior volsella 80–94 μm long, pointed apically, microtrichiose, with 7–8 simple apically split setae. Gonostylus 130–160 μm long, with 7–10 simple median setae in distal 1/3. HR 0.63–0.88, HV 1.5–2.4.

Pupa ($n = 4$).

Total length 5.0–5.6 mm. Exuviae yellow with posterior antepnotum and anal comb on abdominal segment VIII brown.

Cephalothorax (Fig. 33). Frontal apotome smooth. Frontal seta short, 38–40 μm long ($n = 2$). Basal ring oval with major axis 30–40 μm long, the posterior usually with 2–3 small tubercles. Frontal seta 1.0–1.2 times as long as major axis of basal ring. Thorax with one patch of small granules on each side of median suture.

Abdomen (Fig. 34–35). T I without spinulation; T II–V extensively spinulated; T VI–VII with anterior and posterior bands of spinules; T VIII with anterolateral and median spinulation; T IX with median spinulation in female pupa (Fig. 34), but without any spinulation in male. Anterior spinulation on T II–VIII consisting of somewhat large spinules. S I–III and IX without spinulation; S IV–VI with weak posterolateral spinulation; S VII–VIII with weak anterolateral and strong median spinulation, occasionally these merging into extensive spinulation in S VIII (Fig. 39, 40). Tergite II with row of 60–85 caudal hooklets. Conjunctives III/IV and IV/V with rows of spinules. Pedes spurii B distinct on segment II. Anal comb of segment VIII (Fig. 36–38) composed of main spur 30–50 μm long, and 2 or 3 accessory spines 10–30 μm long.

Figures 33–40. *Nilothauma bilobatum* sp. n. pupa. **33** frontal apotome **34** female abdomen, dorsal view **35** abdominal segment VIII, showing variation of tergal spinulation **36–38** anal comb of abdominal segment VIII, showing variation **39** the ventral view of abdomen IV–VIII **40** the ventral view of abdomen VIII, showing variation of sternal spinulation.

Anal lobe 250–280 μm long, 1.8–2.2 times as long as broad, with 41–50 lateral setae, dorsal setae located near the distal margin of disc.

Female imago and larva. Unknown.

Remarks. The male of *N. bilobatum* sp. n. is similar to that of *N. mirabile* (Townes, 1945) as the superior volsella has a lateral spur and two setigerous lobes, but separable by the anterior T IX projection bearing simple setae only and the anal point covered with microtrichia. In *N. mirabile*, the anterior projection has apically plumose setae and the anal point is bare. The pupa of *N. bilobatum* sp. n., as well as that of *N. aristatum* sp. n., will key to “*N. sp. Australia*” in Adam and Sæther (1999). The pupa resembles that of *N. aristatum* sp. n., rather than that of *N. sp. Australia*, in having relatively short frontal setae (1.0–1.2 times as long as the major axis of basal ring), but differs in the anal comb of abdominal segment VIII consisting of a main spur and 2–3 accessory spines. In *N. aristatum* sp. n., the anal comb has a main spur and a single accessory spine.

Distribution. Oriental China (Guangxi Zhuang Autonomous Region and Guangdong Province).

Biological note. The material was collected from two relatively eutrophic reservoirs (conductivity 24–65 $\mu\text{S}/\text{cm}$, dissolved oxygen 6.6–8.3 mg/l). The adults of the following species also occurred from there: *Glyptotendipes tokunagai* Sasa, *Dicrotendipes pelochloris* (Kieffer), *Tanytarsus oscillans* Johannsen, *Cladotanytarsus paratridorsus* Wang & Guo, and *Polypedilum masudai* (Tokunaga).

Nilothauma acre Adam & Sæther

Nilothauma acre Adam & Sæther, 1999: 69.

Material examined. 2 males (LNKU), Jiangxi Province, Qianshan County, 13.vi.2004, Yan CC, light trap; 4 males (LTZU), Zhejiang Province, Taishun County, Wuyanling Natural Conservation Reserve, 1.viii.2005, Qi X, light trap; 1 male (LTZU), Zhejiang Province, Lin-An City, Tianmu Mountain, 16.vii.2012, Lin XL, sweep net.

Remarks. This species was described from Fujian Province in China for the first time by Adam and Sæther (1999).

Distribution. Oriental China (Fujian, Jiangxi, and Zhejiang Provinces).

Nilothauma hibaratertium Sasa

Nilothauma hibaratertia Sasa, 1993: 73.

Tosayusurika simantofea Sasa, Suzuki & Sakai, 1998: 52

Nilothauma hibaratertium Sasa: Adam and Sæther 1999: 71.

Material examined. 1 male (EJNU), Yunnan Province, Mengla County, Menglun Town, Luosuo River at Xishuang Banna Tropical Botanical Garden, 29.viii.2014, Tang

HQ, light trap; 2 males (EJNU), Anhui Province, Huangshan Nature Conservation Reserve, Fuxi stream, 25.v.2012, Tang HQ, light trap; 1 male (EJNU), Guangdong Province, Jiangmen City, Beifengshan Nature Conservation Reserve, 7.vii.2012, Tang HQ, light trap; 2 males (LTZU), Zhejiang Province, Jiangshan City, 12.viii.2012, Lin XL, sweep net; 1 male (LTZU), Zhejiang Province, Linan City, Tianmu Mountain, 16.vii.2012, Lin XL, sweep net; 1 male (EJNU), Fujian Province, Longqishan Nature Conservation Reserve, 14.xi.2012, Tang HQ, light trap; 2 males (EJNU), Fujian Province, Meihuashan Nature Conservation Reserve, 16.xi.2012, Tang HQ, light trap; 1 male (EJNU), Hainan Province, Bawangling Nature Conservation Reserve, 30.iv.2012, Tang HQ, light trap.

Remarks. *N. hibaratertium* has never been described sufficiently, especially in the coloration of the adult. Examination of fresh specimens showed that the foreleg of the adult has distinct dark markings on the base and sub-apex of femora, and the apices of tibia and tarsomere 1. This is the first record of *N. hibaratertium* from the Oriental region; previously, this species has only been recorded from Palearctic Japan (Yamamoto and Yamamoto 2014).

Distribution. Oriental China (Yunnan, Anhui, Guangdong, Zhejiang, Fujian, and Hainan Provinces); Palearctic Japan.

Nilothauma japonicum Niitsuma

Nilothauma japonicum Niitsuma, 1985: 230.

Kribioxenus jintuprimus Sasa, 1990: 32.

Nilothauma jintuprima (Sasa): Sasa and Kikuchi, 1995: 34.

Material examined. 1 male (LTZU), Zhejiang Province, Linhai City, Sanjiang wetland, 01.VI.2010, Li YF, sweep; 1 male (EJNU), Hainan Province, Jianfengling Nature Conservation Reserve, 29.iv.2012, Tang HQ, sweep net.

Remarks. So far this species has been recorded from Thailand, Zhejiang and Hainan Province in China, as well as Palearctic Japan (Adam and Sæther 1999; Yan et. al. 2005; Yamamoto and Yamamoto 2014).

Distribution. Oriental China (Zhejiang, Hainan province); Thailand; Palearctic Japan.

Nilothauma nojirimaculatum Sasa

Nilothauma nojirimaculatum Sasa, 1991: 82.

Material examined. 1 male (EJNU), Hainan Province, Diaoluoshan Natural Conservation Reserve, 27.iv.2012, Tang HQ, light trap; 1 male (EJNU), Guangdong Province, Conghua City, Yugongdong Reservoir, 19.iii.2014, Tang HQ, light trap; 1 male

(EJNU), Guangdong Province, Conghua City, Dongkeng Reservoir, 18.x.2014, Tang HQ, light trap.

Remarks. This species was described from Palaearctic Japan and later recorded from Hainan in China (Adam and Sæther 1999).

Distribution. Oriental China (Hainan and Guangdong Provinces); Palaearctic Japan.
